

Pulverizers type HM

Section of the pulverizer

HM pulverizers are specially suitable for the crushing of a large variety of materials, such as air-dried clay, brick, limestone, slate, burnt gypsum, chalk, fertilizers, salts, soda, alum, pigments, coal, coke, slag, sugar, starch, bone charcoal etc.

The material to be crushed is fed continuously into the upper part of the housing and is pulverized in two stages — partly directly by the hammers and partly against the liner plates in the upper part of the housing.
